

Do You Want to Melt a Snowman?

Science Experiment

You Will Need

Clear bottle with a lid

Orange triangular nose cut out of foam

Black marker pen

Snow

The Activity

1. Begin by filling the bottle with snow.
2. Once it is full, drop the orange foam nose into the bottle so it sits down the side between the snow and the edge of the bottle.
3. Put on the lid and then draw eyes and a mouth on the outside of the bottle with the black marker.
4. Decide where you are going to place the bottle. If several children are doing the experiment they could all choose somewhere different and see where the snowman melts quickest.
5. Once the snowmen have melted you can talk about what's happened. Can anyone think of somewhere the snowman could have gone so that it didn't melt?
