

Make Your Own Frost

Science Experiment

Method

1. Children are to put on their gloves.
2. Clean some tin can (the larger the better). You may wish to use a strong tape to ensure that any sharp edges are covered and made safe.
3. Fill the can at least halfway with ice. You may wish to crush the ice, as this will work better.
4. Add some salt and cold water and stir a little. Now wait!
5. Gradually, frost will start to form on the outside of the tin.
6. Once there is a generous layer of frost, the children can use the mark making tools to draw patterns/shapes around the outside of the tin.

You will need:

Gloves

Tin cans

Ice

Salt

Cold water

Mark making tools

Rolling pin to crush your ice (optional)
